

The future of column-oriented data processing with Arrow and Parquet

Julien Le Dem, Principal Architect Dremio, VP Apache Parquet

HELLO
MY NAME
IS

Julien Le Dem
@J_

- Architect at @DremioHQ  **dremio**
- Formerly Tech Lead at Twitter on Data Platforms.
- Creator of Parquet
- Apache member
- Apache PMCs: Arrow, Incubator, Pig, Parquet

Agenda

- Community Driven Standard
- Interoperability and Ecosystem
- Benefits of Columnar representation
 - On disk (Apache Parquet)
 - In memory (Apache Arrow)
- Future of columnar

Community Driven Standard

An open source standard

- Parquet: Common need for on disk columnar.
- Arrow: Common need for in memory columnar.
- Arrow building on the success of Parquet.
- Benefits:
 - Share the effort
 - Create an ecosystem
- Standard from the start

The Apache Arrow Project

- New Top-level Apache Software Foundation project
 - Announced Feb 17, 2016
- Focused on Columnar In-Memory Analytics
 1. 10-100x speedup on many workloads
 2. Common data layer enables companies to choose best of breed systems
 3. Designed to work with any programming language
 4. Support for both relational and complex data as-is
- Developers from 13+ major open source projects involved
 - A significant % of the world's data will be processed through Arrow!

Calcite
Cassandra
Deeplearning4j
Drill
Hadoop
HBase
Ibis
Impala
Kudu
Pandas
Parquet
Phoenix
Spark
Storm
R

Interoperability and Ecosystem

Shared Need => Open Source Opportunity

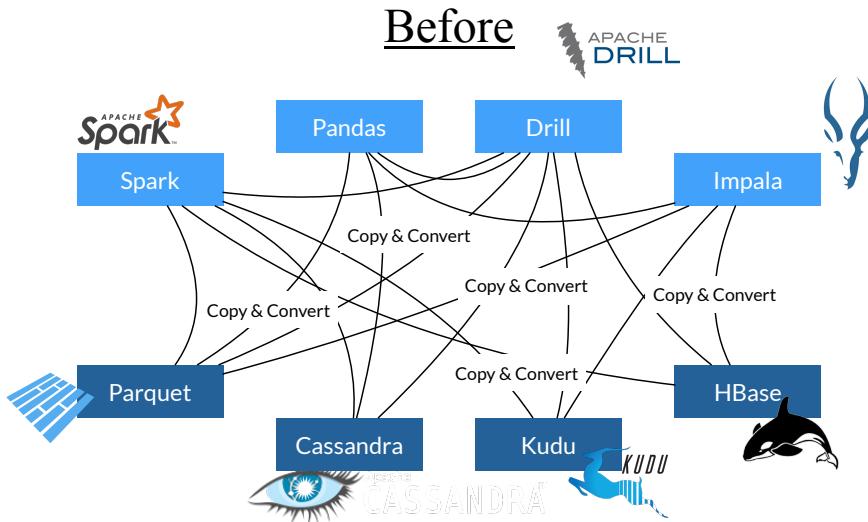

“We are also considering switching to a columnar canonical in-memory format for data that needs to be materialized during query processing, in order to take advantage of SIMD instructions” -Impala Team

“Drill provides a flexible hierarchical columnar data model that can represent complex, highly dynamic and evolving data models and allows efficient processing of it without need to flatten or materialize.” -Drill Team

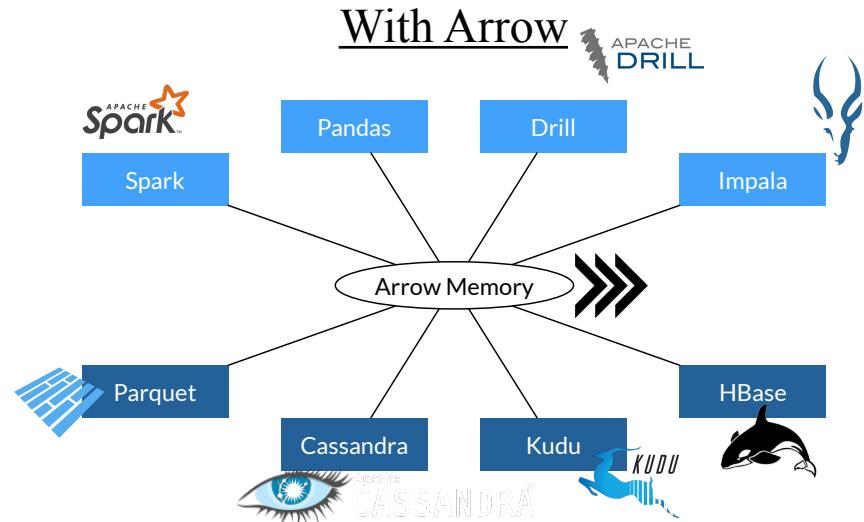

“A large fraction of the CPU time is spent waiting for data to be fetched from main memory...we are designing cache-friendly algorithms and data structures so Spark applications will spend less time waiting to fetch data from memory and more time doing useful work” – Spark Team

High Performance Sharing & Interchange

- Each system has its own internal memory format
- 70-80% CPU wasted on serialization and deserialization
- Functionality duplication and unnecessary conversions

- All systems utilize the same memory format
- No overhead for cross-system communication
- Projects can share functionality (eg: Parquet-to-Arrow reader)

Benefits of Columnar formats

@EmergencyKittens

Columnar layout

Logical table
representation

a	b	c
a1	b1	c1
a2	b2	c2
a3	b3	c3
a4	b4	c4
a5	b5	c5

Row layout

Column layout

On Disk and in Memory

- Different trade offs
 - On disk: Storage.
 - Accessed by multiple queries.
 - Priority to I/O reduction (but still needs good CPU throughput).
 - Mostly Streaming access.
 - In memory: Transient.
 - Specific to one query execution.
 - Priority to CPU throughput (but still needs good I/O).
 - Streaming and Random access.

Parquet on disk columnar format

Parquet on disk columnar format

- Nested data structures
- Compact format:
 - type aware encodings
 - better compression
- Optimized I/O:
 - Projection push down (column pruning)
 - Predicate push down (filters based on stats)

Access only the data you need

Columnar

a	b	c
a1	b1	c1
a2	b2	c2
a3	b3	c3
a4	b4	c4
a5	b5	c5

Statistics

+

a	b	c
a1	b1	c1
a2	b2	c2
a3	b3	c3
a4	b4	c4
a5	b5	c5

Read only the
data you need!

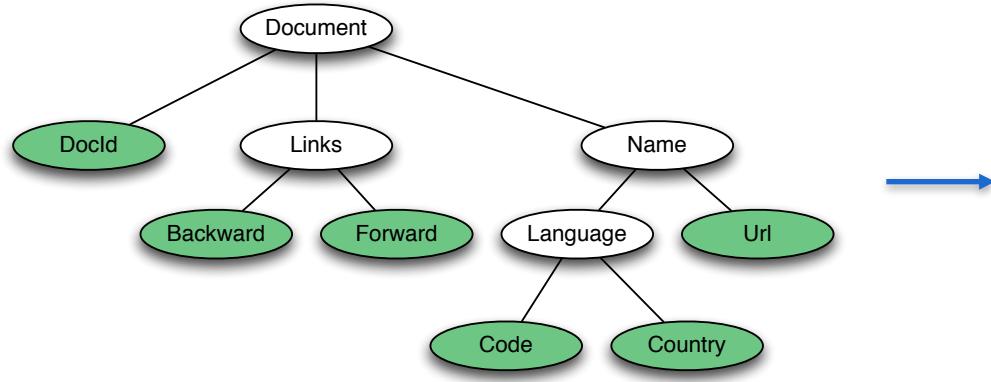

=

a	b	c
a1	b1	c1
a2	b2	c2
a3	b3	c3
a4	b4	c4
a5	b5	c5

Parquet nested representation

Borrowed from the Google Dremel paper

Columns:

- docid
- links.backward
- links.forward
- name.language.code
- name.language.country
- name.url

Arrow in memory columnar format

Arrow goals

- Well-documented and cross language compatible
- Designed to take advantage of modern CPU characteristics
- Embeddable in execution engines, storage layers, etc.
- Interoperable

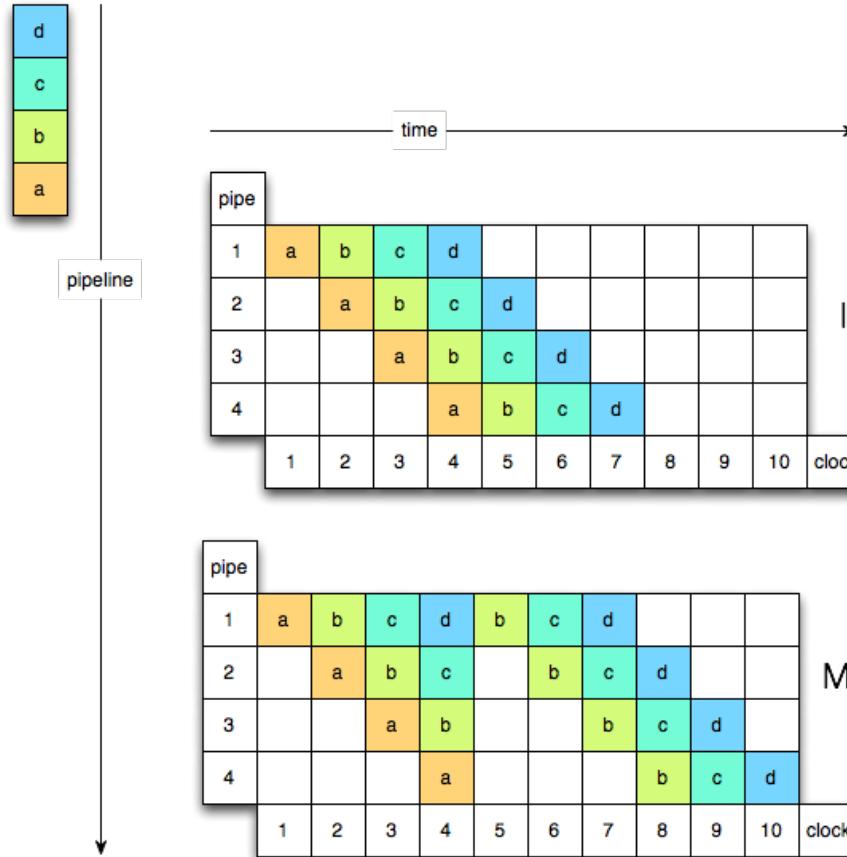

Arrow in memory columnar format

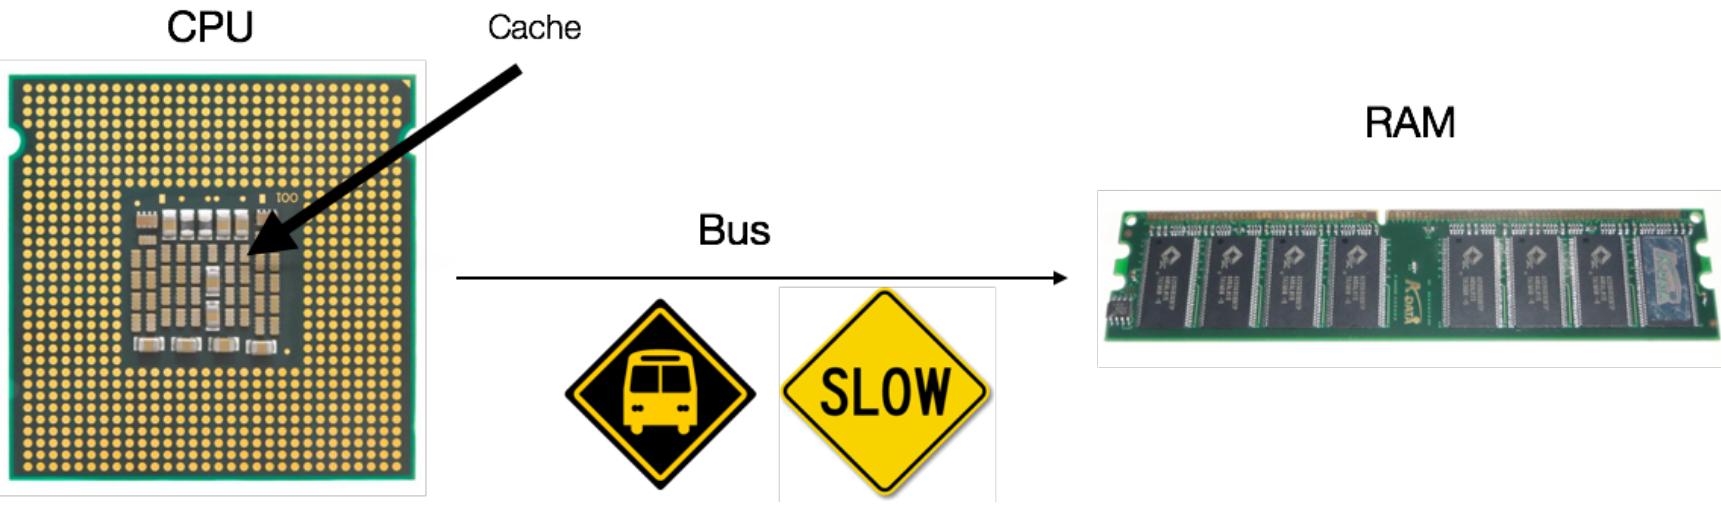

- Nested Data Structures
- Maximize CPU throughput
 - Pipelining
 - SIMD
 - cache locality
- Scatter/gather I/O

CPU pipeline

Minimize CPU cache misses

a cache miss costs 10 to 100s cycles depending on the level

Focus on CPU Efficiency

- Cache Locality
- Super-scalar & vectorized operation
- Minimal Structure Overhead
- Constant value access
 - With minimal structure overhead
- Operate directly on columnar compressed data

	session_id	timestamp	source_ip

Arrow Messages, RPC & IPC

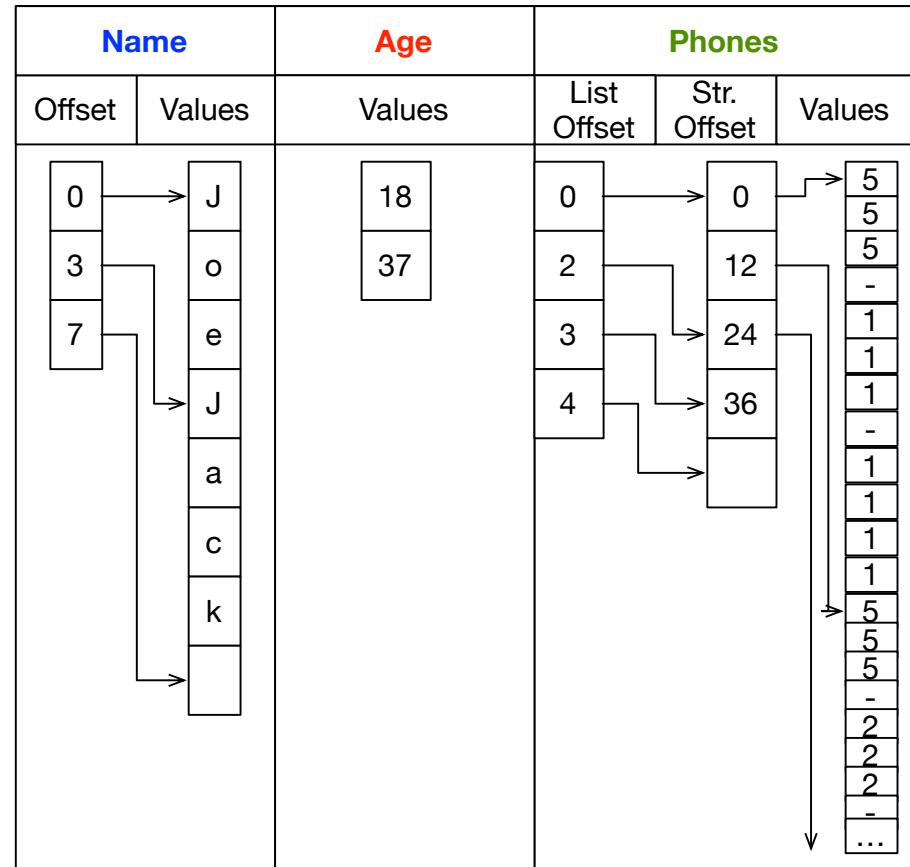

Common Message Pattern

- Schema Negotiation
 - Logical Description of structure
 - Identification of dictionary encoded Nodes
- Dictionary Batch
 - Dictionary ID, Values
- Record Batch
 - Batches of records up to 64K
 - Leaf nodes up to 2B values

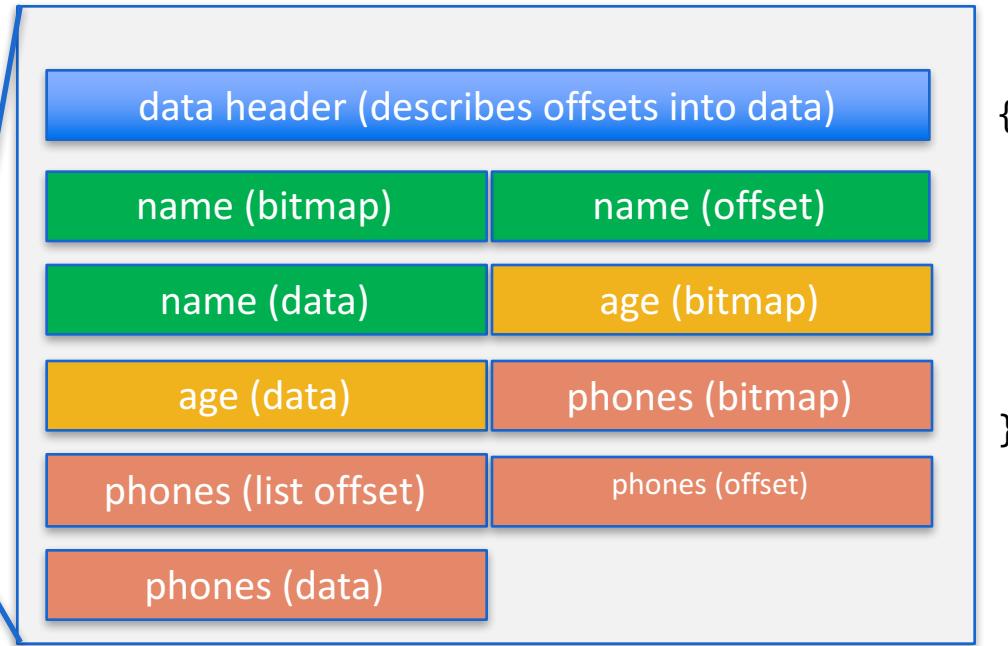

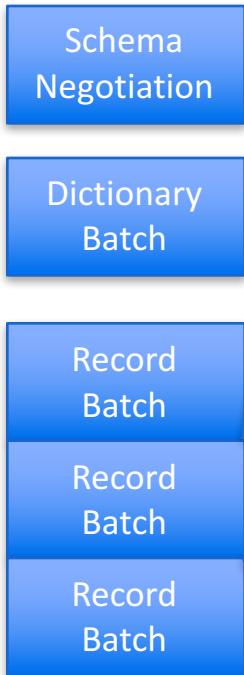

Columnar data

```
persons = [{  
    name: 'Joe',  
    age: 18,  
    phones: [  
        '555-111-1111',  
        '555-222-2222'  
    ]  
}, {  
    name: 'Jack',  
    age: 37,  
    phones: [ '555-333-3333' ]  
}]
```

Record Batch Construction

```
{  
  name: 'Joe',  
  age: 18,  
  phones: [  
    '555-111-1111',  
    '555-222-2222'  
  ]  
}
```

Each box (vector) is contiguous memory
The entire record batch is contiguous on wire

Moving Data Between Systems

RPC

- Avoid Serialization & Deserialization
- Layer TBD: Focused on supporting vectored io
 - Scatter/gather reads/writes against socket

IPC

- Alpha implementation using memory mapped files
 - Moving data between Python and Drill
- Working on shared allocation approach
 - Shared reference counting and well-defined ownership semantics

Java: Memory Management

- Chunk-based managed allocator
 - Built on top of Netty's JEMalloc implementation
- Create a tree of allocators
 - Limit and transfer semantics across allocators
 - Leak detection and location accounting
- Wrap native memory from other applications

Language Bindings

Parquet

- Target Languages
 - Java
 - CPP
 - Python & Pandas
- Engines integration:
 - Many!

Arrow

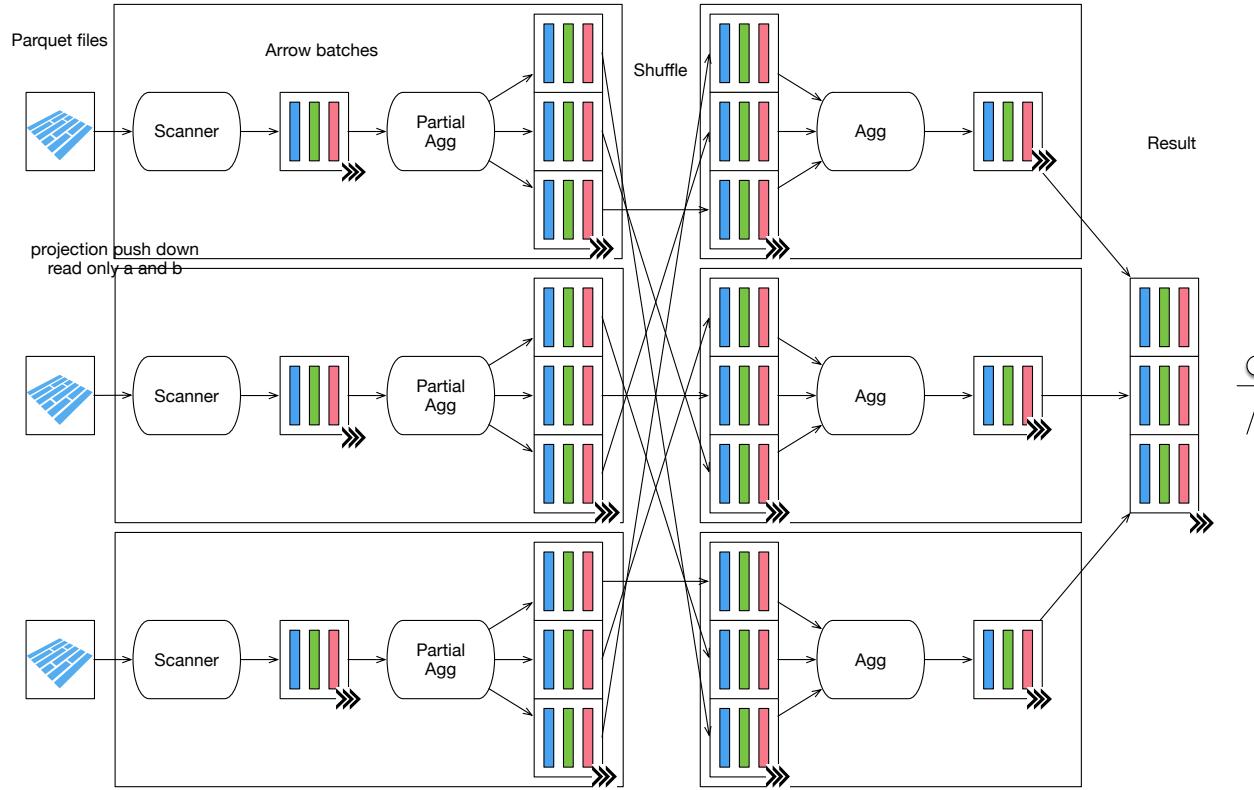

- Target Languages
 - Java
 - CPP, Python
 - R (underway)
- Engines integration:
 - Drill
 - Pandas, R
 - Spark (underway)

Execution examples:

RPC: Single system execution

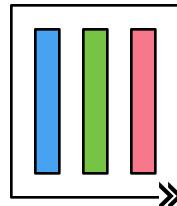

The memory representation is sent over the wire.

No serialization overhead.

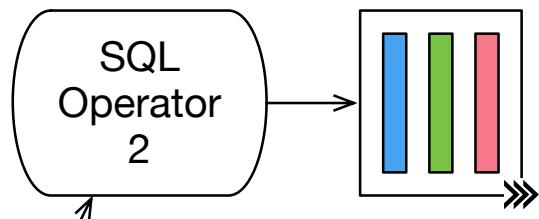

SELECT SUM(a) FROM t GROUP BY b

Multi-system IPC

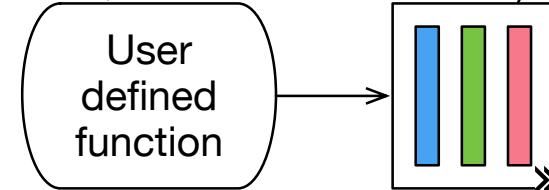

SQL engine

reads

reads

Python process

Summary and Future

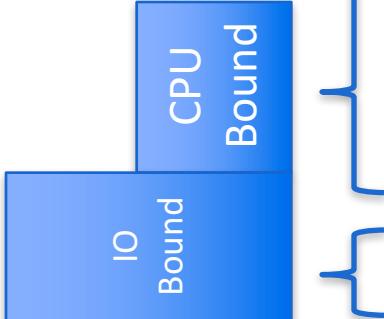

© 2016 Dremio Corporation

@DremioHQ

Where is the bottleneck?

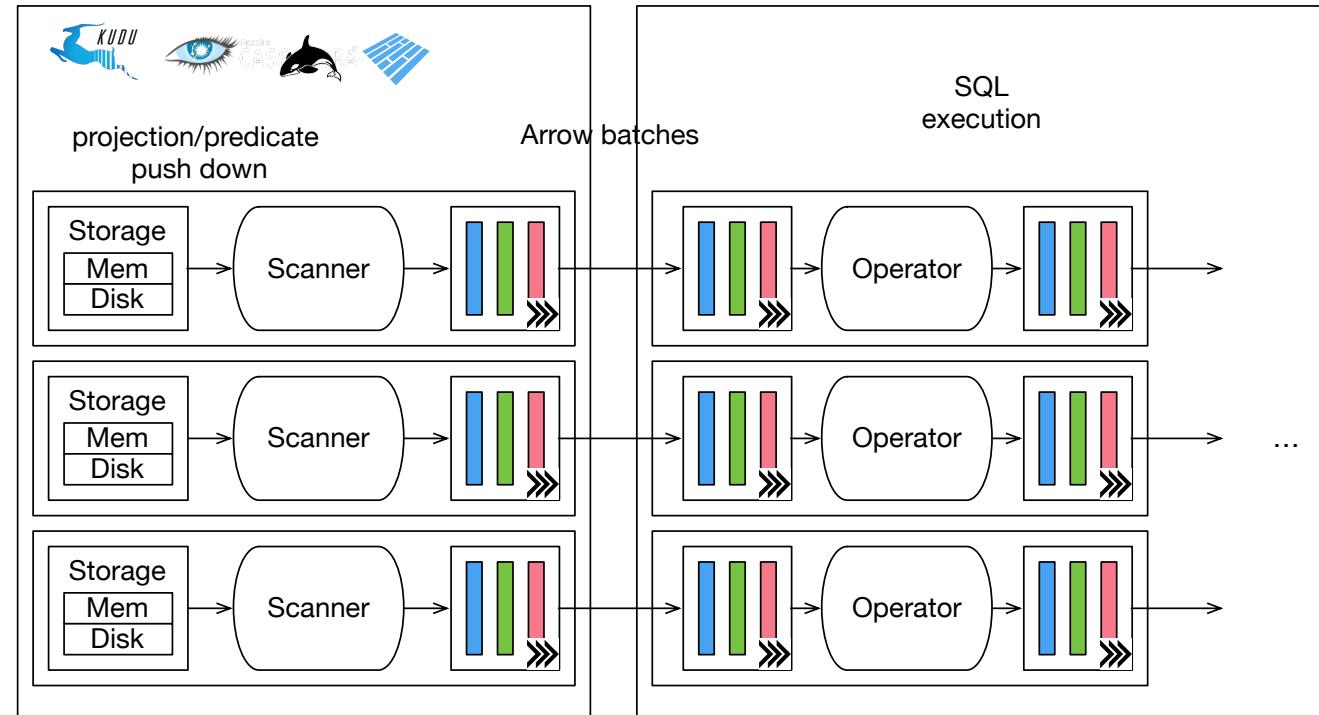

L1 cache reference	1x
Branch mispredict	3x
L2 cache reference	4x
Main memory reference	100x
Non-volatile Memory	200x
3D Xpoint Read	1600x
RDMA Read	1600x
SSD Read	16,000x
Spinning Disk read	3,000,000x

RPC: arrow based storage interchange

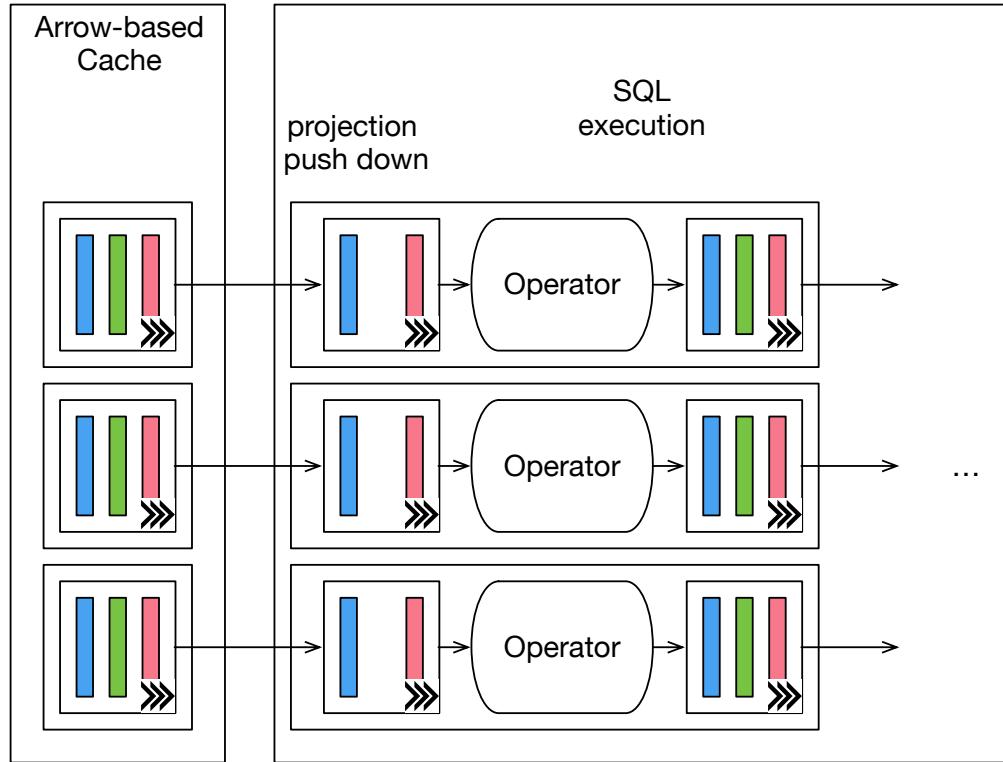

The memory representation is sent over the wire.

No serialization overhead.

RPC: arrow based cache

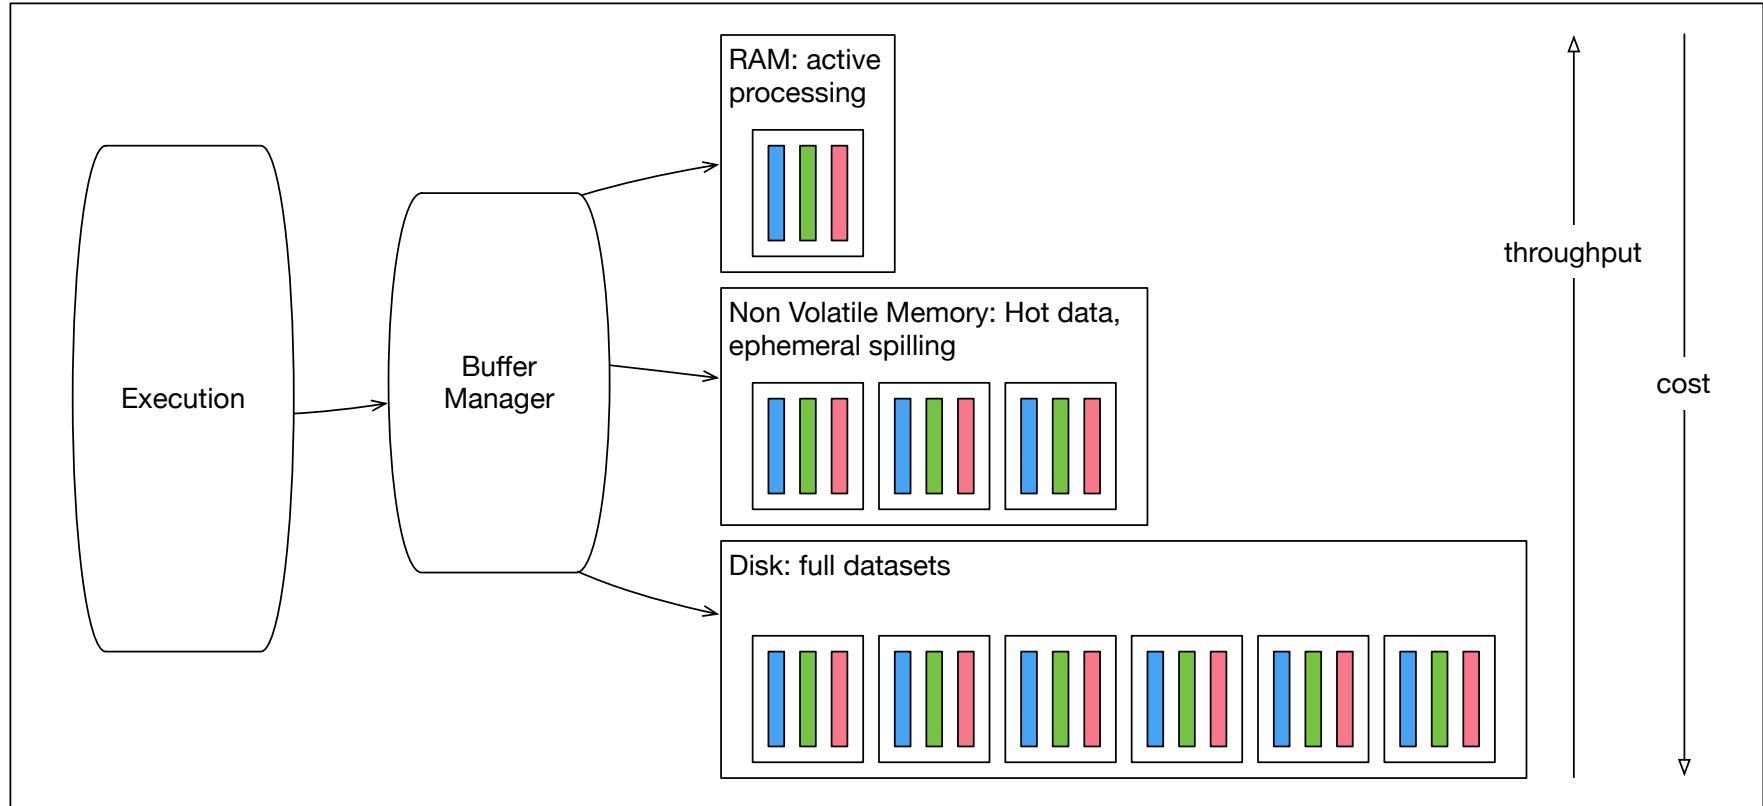

The memory representation is sent over the wire.

No serialization overhead.

Storage tiering with Non Volatile Memory

What's Next

- Parquet – Arrow Nested support for Python & C++
- Arrow IPC Implementation
- Arrow RPC & HTTP/2
- Kudu – Arrow integration
- Apache {Spark, Drill} to Arrow Integration
 - Faster UDFs, Storage interfaces
- Support for integration with Intel's Persistent Memory library via Apache Mnemonic
